

guestPresence™

“If I’m in the room no one knocks on my door,
even if I forget to select Privacy”

What It Does

guestPresence™ allows your staff to determine if a guest is in the room without disturbing the guest. Simply point our [Mini Remote](#) at the outside indicators and our SmartSign™ Module will respond with a light indicating if there is a guest in the room.

How It Works

Using a combination of motion and contact sensors guestPresence™ is able to accurately determine if a guest is in the room. After the guest room door closes a scan is made of the room for any guest motion. This sets the system to “Guest Present”. This status is re-evaluated after the guest room door opens and closes. Only hotel staff can obtain that status information. This allows staff to leave guests in undisturbed privacy.

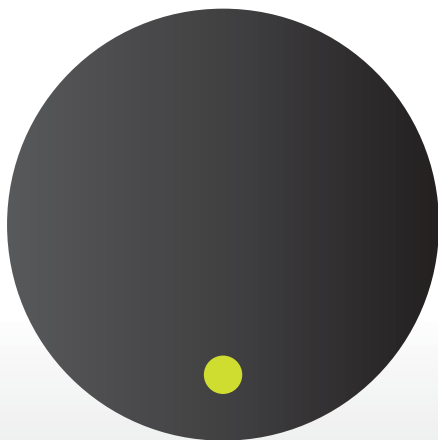

The Devices

Axxess [Wireless Motion Sensors](#) and [Contact Sensors](#) are beautifully designed to blend into any environment. Together the two devices provide accurate information on the current occupancy status of a room.

Guest room attendants are issued an inexpensive mini-remote to obtain guest presence status.

The Software

Now you can view the status of any room in your entire hotel, know if a guest is in the room or not before knocking, and avoid sending staff to rooms that are marked DND. All from any device with web access.

Guests Disturbed

Before ■ With Axxess ■

The Math

Over 50% of rooms that housekeepers knock on have the occupants inside the room - simply because they don't know the guest is present. The general rule is that housekeepers should not make up rooms when guests are present. Therefore 100% of these disturbances are unnecessary. By providing info on a room's guest-in-room status [guestPresence™](#) increases both your housekeeping efficiency and guest satisfaction.

Happy guests return, disgruntled guests tell others. Improve your bottom line: Axxess [guestPresence™](#).
